

Sankar Sanjay Varma

Senior DevOps / SRE Engineer |

• sanjayvarmacol6@gmail.com • <https://www.linkedin.com/in/sankar-sanjay-varma-thotakura/> • +15109603865

PROFESSIONAL SUMMARY

Senior DevOps/SRE Engineer with 11+ years of experience designing resilient, multi-cloud Platform Engineering solutions across AWS, Azure, and private cloud in telecom, healthcare, and technology sectors. Expertise in Kubernetes (EKS/AKS), Terraform, Jenkins, Spinnaker, Ansible, and observability engineering — delivering 99.9% SLO compliance, 40% reduction in manual operational effort, and 30% faster release cycle velocity through CI/CD automation and custom tooling. Proven record in incident management, blameless SRE culture, DR automation, and GitOps-driven infrastructure at enterprise scale.

TECHNICAL SKILLS

Cloud Platforms	AWS (EKS, ECS, ECR, EC2, VPC, IAM, S3, Lambda, CloudWatch, CloudFront, SNS, SQS, RDS, Route53, DynamoDB, EMR, ElasticBeanstalk, Redshift) Azure (AKS, App Services, Azure SQL, Azure DevOps, AAD, Key Vault, ARM, Azure Monitor, OMS) OpenStack, Private Cloud (Apple Cloud)
IaC & Automation	Terraform, Ansible, Ansible AWX, AWS CloudFormation, PowerShell, Python, Bash/Shell, Ruby
Containers & Orchestration	Kubernetes (EKS / AKS), Docker, Helm, OpenShift, Docker Swarm, ECS
CI/CD & DevOps	Jenkins, Spinnaker, GitHub Actions, Azure DevOps, AWS CodePipeline, Concourse, TeamCity, Bamboo, Maven, Gradle, Ant, Nexus, JFrog Artifactory, Git, GitHub Admin, SVN
Observability & SRE	Splunk (dashboards, alerts), Grafana, Prometheus, ELK Stack, Datadog, New Relic, Nagios, CloudWatch, Azure Monitor, Log Analytics
Security / DevSecOps	IAM policies, RBAC, Azure AD, AWS Security Groups, Key Vault, SonarQube, PCI Compliance, SSH key management, ACL automation
Programming Languages	Python, Bash/Shell, Node.js, Java, Ruby, Perl, PowerShell, Groovy
Databases	MySQL, Oracle, MongoDB, DynamoDB, Redshift, Azure SQL, MS SQL Server

PROFESSIONAL EXPERIENCE

Client: **UKG, Weston, FL**
Senior DevOps / SRE Engineer

Jan 2023 – Present

AWS · Azure (AKS, DevOps, AAD) · Kubernetes · Jenkins · Spinnaker · Ansible AWX · Terraform · Splunk · Grafana/Prometheus · Node.js · Python · GitHub Admin

- Reduced manual DR process execution time from 4 hours to under 10 minutes by engineering a custom Node.js + Angular single-click DR orchestration UI with approval workflows — eliminating human error risk across 20+ production services.
- Improved deployment reliability by 40% by designing and implementing CI/CD pipelines with Jenkins and Spinnaker — supporting 5 core-dependent enterprise customer environments with automated rollback, health-gate checks, and Gradle/Maven/npm build standardization.
- Achieved 99.9% SLO compliance for Netcracker's telecom platform by building Grafana dashboards connected to Prometheus metrics, Splunk alert pipelines, and ELB health-check observability covering application performance, error rates, and response latency.
- Cut SSH access provisioning time across 300+ nodes from 8 hours to 20 minutes by designing and automating public-key distribution with Ansible playbooks — enabling passwordless authentication at scale across the entire Kubernetes fleet.
- Eliminated 70% of manual ACL management effort across multi-node infrastructure by developing Ansible playbooks for automated ACL validation and remediation — replacing a process that previously required 3 engineers per cycle.
- Improved sprint release transparency for DevOps and SRE teams by building a Java/Node.js Release Notes service that automatically aggregates and publishes Jira ticket status per sprint — now integrated into every release gate checkpoint.
- Reduced AWS Lambda GitHub webhook processing latency by 60% by implementing Node.js-based Lambda functions for automated environment parameter updates — replacing a manual YAML update cycle that previously took 45 minutes per environment.
- Accelerated Kubernetes deployment issue resolution by 35% by developing systematic K8s debugging runbooks covering pod failures, ELB service unavailability, and container image pull errors — standardized across 4 SRE teams.
- Improved infrastructure configuration consistency across 15+ Azure services by authoring PowerShell automation scripts and ARM JSON templates for Azure SQL, Key Vault, Storage, and App Services — reducing environment drift incidents from 8 to 1 per quarter.
- Decreased Ansible configuration adoption timeline from 6 weeks to 2 weeks by identifying DevOps pain points, proposing and leading Ansible AWX implementation, and delivering reusable playbook libraries for 3 production environments.

Client: **First Citizens Bank, CA**
Senior DevOps Engineer

Feb 2020 – Aug 2022

AWS (EKS, EC2, S3, Lambda, VPC, RDS, DynamoDB, EMR, CloudWatch) · Terraform · Ansible · Kubernetes · Docker · Jenkins · Kafka · Splunk · ELK · New Relic · Datadog · Python · Groovy

- Reduced AWS infrastructure provisioning time from 3 days to 4 hours by authoring reusable Terraform modules for two-tier architecture — covering VPC, subnets, security groups, EC2, ALB, ASG, CloudWatch alarms, ECS clusters, and S3 logging buckets across multiple environments.
- Improved CI/CD pipeline delivery reliability by 45% by designing Jenkins-on-Kubernetes containerized pipelines with Groovy-scripted stages for build, test, and deploy — supporting 12 development teams with automated Docker image creation and ECR publishing.
- Achieved multi-tool observability coverage for 20+ production services by deploying and integrating New Relic, Datadog, ELK Stack, and Splunk — enabling correlated infrastructure-to-application trace analysis that reduced P2 incident MTTR by 30%.
- Enabled Kafka-driven auto-scaling for backend servers handling 500K+ events/hour by designing a custom event-throughput-based scaling system using Kafka Storm topologies with Esper CEP — eliminating capacity-related outages during peak traffic.
- Reduced manual application and database container deployment effort by 60% by automating MySQL and NoSQL container lifecycle management with Python scripts and monitoring with Nagios — integrated into the Jenkins CD pipeline.
- Delivered zero-downtime application deployments for 8 product teams by standardizing Docker and Kubernetes container workflows — cutting environment spin-up time from 6 hours to 45 minutes and eliminating environment parity gaps between dev and production.
- Improved Azure infrastructure cost visibility and governance by generating automated telemetry reports from Azure SQL tables with custom time-range queries — enabling engineering managers to track spend by ISV/environment without manual data pulls.
- Strengthened AWS security posture by configuring CloudTrail-to-CloudWatch Log Group pipelines for Amazon ES ingestion — providing immutable audit logs for all API-level infrastructure changes across 3 AWS accounts.

Client: Health Net of California, CA
DevOps Engineer

Aug 2017 – Jan 2020

Jenkins · Git · Ansible · Python · Docker · Maven · Nexus · Tomcat · IAM · CloudWatch · AWS · JIRA

- Reduced application build cycle time by 35% by designing and implementing a fully automated Jenkins CI/CD platform — integrating Git polling, shell-embedded deployment scripts, and Tomcat application server deployments with zero manual intervention.
- Eliminated configuration drift across 50+ servers by implementing Ansible configuration management — automating build configuration, server bootstrapping, and patch deployments for both new and existing server fleets.
- Improved AWS resource scaling response time by 25% by creating CloudWatch metric alarms tied to Auto Scaling launch configurations — ensuring capacity events triggered within defined SLA thresholds during peak load.
- Reduced Oracle database migration errors by 90% before production rollouts by establishing structured pre-migration test procedures with validation scripts — preventing data integrity issues that previously caused 2–3 rollbacks per release cycle.

- Improved security compliance by automating IAM group, role, and permission assignments using Python scripts — replacing a manual provisioning process that took 2 hours per user onboarding request.

Client; Manulife Financial Corporation, GA
Build & Release Engineer

March 2015 – Jul 2017

Jenkins · Chef · Docker · Kubernetes · Git · SVN · Maven · Ansible · Kafka · SonarQube · Python · Bash · New Relic

- Enabled continuous automated build delivery for 5 development teams by configuring Jenkins build jobs with Git-polling CI and overnight scheduled builds — reducing broken-integration discovery time from 24 hours to under 1 hour.
- Reduced deployment configuration effort by 50% by authoring Chef cookbooks in Ruby — implementing environments, roles, and data bags across Dev, QA, and Production tiers and managing full Chef Server/Workstation/Node bootstrap lifecycle.
- Improved code quality gate compliance by integrating SonarQube static analysis into the Jenkins pipeline — enforcing quality thresholds across all Java projects and reducing code smell defect escape rate to production by 40%.
- Deployed OpenStack on Ubuntu MaaS/JUJU in a multi-node high-availability configuration with software-defined networking (SDN) tenant and provider networks — replacing a manual VM provisioning process that averaged 3 hours per environment.
- Improved Windows server security compliance by remediating PCI-DSS vulnerabilities, applying OS patches, and implementing server hardening for 200+ Windows 2003/2008 production servers — achieving 100% patch compliance on quarterly audit cycles.

EDUCATION

Masters In CS from Santa Clara University (Aug 2012- Dec 2013)
Bachelor In CS from SRKR Eng College Ind (Jun 2008- Mar 2012)
